

EXPERIMENTS IN ORGANIC CHEMISTRY

 Universidad del País Vasco Euskal Herriko Unibertsitatea		EUSKAL HERRIKO UNIBERTSITATEA KIMIKAKO FAKULTATEA KIMIKA ORGANIKAKOIA I SAILA
<b>EXPERIMENTATION IN ORGANIC CHEMISTRY</b>		<b>Practice number:</b>
<b>FAMILY, FIRST NAME:</b> Mirane Florencio Zabaleta		<b>DATE:</b> 27/04/2020
<b>A</b>	<b>MAIN FEATURES IN THE PRACTICE</b>	
A.1	Main objective of the practice	
<p>The synthesis of a complex compound starting from a simple one.</p> <p>To perform two of the basic reactions in organic chemistry, elimination and addition, in the laboratory.</p>		
A.2	Mechanism of the reaction	
 <p style="text-align: center;">cyclohexanol</p> <p style="text-align: center;">(1<i>R</i>,2<i>R</i>)-1,2-dibromocyclohexane</p>		

## EXPERIMENTS IN ORGANIC CHEMISTRY

A.3	Dangerous reagents	Preventive Measures; H and P phrases
	Cyclohexanol	H302+H312+H332 Harmful if swallowed, in contact with skin or if inhaled. H315 Causes skin irritation. P302+P352 IF ON SKIN: Wash with plenty of soap and water. P304+P340 IF INHALED: Remove person to fresh air and keep comfortable for breathing.
	Bromine	H314 Causes severe skin burns and eye damage. H330 Fatal if inhaled. P260 Do not breathe dust/ fume/ gas/ mist/ vapours/ spray. P273 Avoid release to the environment
	CH <sub>2</sub> Cl <sub>2</sub>	H351: Suspected of causing cancer [Warning Carcinogenicity]. P201: Obtain special instructions before use. P202: Do not handle until all safety precautions have been read and understood.
	H <sub>3</sub> PO <sub>4</sub>	H314: Causes severe skin burns and eye damage [Danger Skin corrosion/irritation]. P260: Do not breathe dust/fume/gas/mist/vapors/spray. P264: Wash thoroughly after handling.
	Na <sub>2</sub> CO <sub>3</sub>	H319: Causes serious eye irritation [Warning Serious eye damage/eye irritation] P280: Wear protective gloves/protective clothing/eye protection/face protection
	Na <sub>2</sub> SO <sub>4</sub> (anhy.)	H315 (100%): Causes skin irritation [Warning Skin corrosion/irritation] H318 (100%): Causes serious eye damage [Danger Serious eye damage/eye irritation]
A.4	Experimental procedure	
<p>Elimination:</p> <ol style="list-style-type: none"> <li>1. Take 20mL of Cyclohexanol and weight it in the bottom round flask. Then, add 6mL of H<sub>3</sub>PO<sub>4</sub> to the flask and stir it.</li> <li>2. After that, we have to prepare the set up so as to do the distillation.</li> <li>3. Start with the heating, heat the flask gently (for 15-30min) and make sure it doesn't go up 100°C.</li> <li>4. Then we have to do the purification of the compound, we have to get rid of the water and cyclohexanol we obtained with the cyclohexene.</li> <li>5. We will pour the distillation product to the extraction funnel and we will add NaCl aqueous solution. We will shake the funnel and get rid of the gasses.</li> <li>6. We will extract first the aqueous phase and then we will collect the organic one in an Erlenmeyer flask.</li> <li>7. Then, we have to dry the cyclohexene, so we will add some Na<sub>2</sub>SO<sub>4</sub> and let to settle.</li> <li>8. Filtrate the solution and prepare a second distillation to finish with the purification, collect the cyclohexene and weight the product.</li> </ol> <p>Addition:</p> <ol style="list-style-type: none"> <li>9. Take 100mg of the compound obtained and dissolved in CH<sub>2</sub>Cl<sub>2</sub>.</li> <li>10. Add slowly Br<sub>2</sub>/CH<sub>2</sub>Cl<sub>2</sub> to the solution while stirring gently. Add until no color change happens, until the remaining color is red.</li> <li>11. Then we will use a rotavapor so as to eliminate the excess of bromine and the CH<sub>2</sub>Cl<sub>2</sub>.</li> </ol>		

## EXPERIMENTS IN ORGANIC CHEMISTRY

B		RESULTS																														
B.1	<b>Molecular formula:</b> C <sub>6</sub> H <sub>10</sub>	<b>M.W. (g/mol):</b> 82,143	<b>Density:</b> 0,811	<b>State:</b> Liquid	<b>Color:</b> It has no color.																											
	<b>Theoretical weight or volume of the final product:</b> $g = 0,192 \times 82,143 = 15,77g$		<b>Theoretical melting point or boiling point (°C):</b> - Boiling point: 83°C - Melting point: -103,5°C																													
	<b>Measured experimental weight or volume of the final product:</b> $g = 10g$																															
	<b>Molecular Formula:</b> C <sub>6</sub> H <sub>10</sub> Br <sub>2</sub>	<b>M.W. (g/mol):</b> 241,95	<b>Density:</b> 1,784	<b>State:</b> Liquid	<b>Color:</b> colorless, slightly yellow																											
<b>Theoretical weight or volume of the final product:</b> $g = 0,998 \times 10^{-3} \times 241,95 = 0,241g$		<b>Theoretical melting point or boiling point (°C):</b> - Boiling point: 145°C - Melting point: -5°C																														
<b>Measured experimental weight or volume of the final product:</b> $g = 0,2g$

B.3	Spectroscopic Data:
<p>Cyclohexene:</p> <ul style="list-style-type: none"> <li>• <math>^1\text{H}</math> NMR: <ul style="list-style-type: none"> <li><math>\delta</math> 5,67 the singlet belongs to proton Ha.</li> <li><math>\delta</math> 1,99-1,49 the singlet has to do with Hb and Hc.</li> <li><math>\delta</math> 1,69-1,49 This singlet belongs to Hd.</li> </ul> </li> <li>• <math>^{13}\text{C}</math> NMR: <ul style="list-style-type: none"> <li><math>\delta</math> 127,3 it has to do with the carbon that belongs to de alkene (C1).</li> <li><math>\delta</math> 25,3 it belongs to C2.</li> <li><math>\delta</math> 22,8 it belongs to C3.</li> </ul> </li> <li>• IR: <p>There is an interesting peak at around 1600 wavenumbers, that can symbolize the double bond of the cyclohexene. We also have an aliphatic stretching in around 2900 wavenumbers.</p> </li> </ul> <p>1,2-dibromocyclohexane:</p> <ul style="list-style-type: none"> <li>• <math>^1\text{H}</math> NMR: <ul style="list-style-type: none"> <li><math>\delta</math> 4,54-4,30 a multiplate that belongs to Ha.</li> <li><math>\delta</math> 2,41 another multiplate that belongs to Hb.</li> <li><math>\delta</math> 1,93-1,62 a multiplate that has to do with Hc.</li> <li><math>\delta</math> 1,62-1,36 a multiplate that belongs to Hd.</li> </ul> </li> <li>• <math>^{13}\text{C}</math> NMR: <ul style="list-style-type: none"> <li><math>\delta</math> 55,2 it belongs to C1.</li> <li><math>\delta</math> 31,9 it belongs to C2.</li> <li><math>\delta</math> 22,4 it has to do with C3.</li> </ul> </li> <li>• IR: <p>We can see that the signals mentioned before disappear and that in the right side appears a pointed signal at around 550 wavenumbers. We can assume that this signal belongs to an halogenated bond.</p> </li> </ul>	
B.4	Conclusions
<p>Even if we couldn't course the subject as we were supposed to, we have learned how to perform two of the basic reactions in organic chemistry, as the mechanism. This all has been useful to the theoretical subject and somehow also to have an idea of the experimental procedure.</p>
